Using your favorite linking program (TILP or TI-Connect), install the files from the ROM folder into the Archive of your 84+CSE, and drop the files from the RAM folder into the RAM of your 84+CSE.

To run this program, run prgmPRESDB from the prgm menu. It uses one ASM program (The first asm library available on the 84+CSE with the help of Kerm Martian of Cemotech!) and it has been fully tested to not cause problems with your calculator that may result in data loss. You should always keep a fresh backup of your calculator's memory in case a program causes a crash!

Once the main menu pops up, you will have 3 choices; Database, Flashcards, and Exit. You use the left and right arrows to choose between the three options and use the 2<sup>nd</sup> key to make your selection.

Choosing the Database:

As of right now, all you can do is scan through the names and pick one. This is done via the up and down arrow keys. Press 2<sup>nd</sup> on a name that you wish to view. There is no data available on any president, and it will tell you so, next to their picture. This particular process will take a while, and I will progressively update as I can get information added about each president. Pressing MODE will exit this function.

Choosing Flashcards:

This is a game of sorts, to test your memory on what each president we've had looks like. Press the number on the number pad that correlates to the name you think belongs to the president pictured. Press 0 to skip if you don't know, press MODE to quit the game and get your score.
